

# Hadoop Hive Date Functions and Examples

Updated on September 30, 2019 by [Vithal S](#)

[Learn more](#)

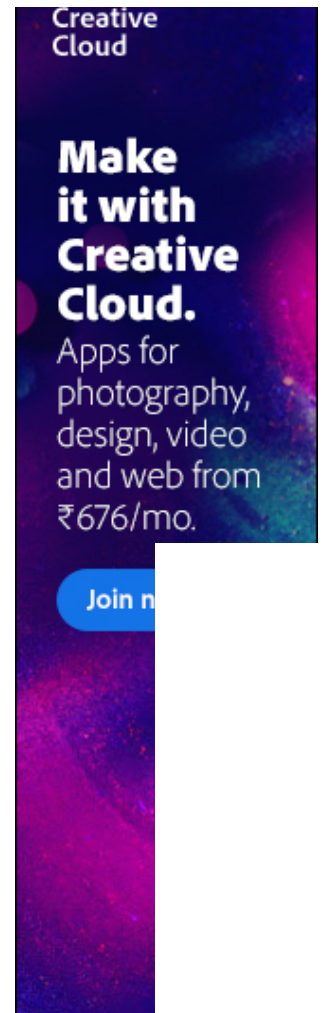

Many applications manipulate the date and time values. Latest Hadoop Hive query language support most of relational database date functions. In this article, we will check commonly used Hadoop Hive date functions and some of examples on usage of those functions.

## Hadoop Hive Date Functions and Examples

### Hadoop Hive Date Functions

Date types are highly *formatted* and very *complicated*. Each date contains the century, year, month, day, hour, minute, and second. We shall see how to use the Hadoop Hive date functions with examples. You can use these functions as Hive date conversion functions to manipulate the date data type as per the application requirements. Below are the most commonly used Hadoop Hive DateTime functions:

ent_timestamp()	Returns the current date and time of the system. There is no now() function is Hadoop Hive.
ent_date()	Returns the current date of the system without any time part.
months(timestamp date, int months)	Adds month value to specified date or timestamp values.
ate(timestamp date)	Converts Hive timestamp value to date data type.
_add(timestamp startdate, days)	Adds days to specified timestamp value. Hive does not support interval data type in date_add. You can use <b>interval type directly</b> to add or subtract from date values
_sub(timestamp startdate, days)	Subtract specified number of days from the date or timestamp value.
diff(timestamp enddate, timestamp startdate)	timestamp startdate)
diff(timestamp enddate, timestamp startdate)	Returns number of days between the two date or timestamp values.
_unixtime(bigint unixtime[, g format])	Converts the number of seconds from the Unix epoch to the

potted a few typos. 'yyymmdd' should be 'yyyyMMdd'.  
date\_add and date\_sub adds and subtracts 1 day, not 1  
month.

Vithal Sampagar says

[December 19, 2017 at 2:49 am](#)

Hi Dhanesh,

Thanks for writing back! Corrected typos.

'yyymmdd' is also accepted in Hive. Below is the  
example for your reference:

```
hive> select  
from_unixtime(unix_timestamp(current_date()),
```

20170019

Time taken: 1.196 seconds, Fetched: 1 row(s)

Shiv says

mm returns 00, it should be MM and also dd should always be dd.
